ABSTRACT

The Complaint Tracker is a Java-based console application developed to simplify and organize customer complaint management. In many organizations, complaints are handled manually through phone calls, emails, paper forms, or spreadsheets. This can cause missing records, delayed responses, duplicate complaints, and difficulty in tracking complaint status.

The proposed system allows a user to sign in and register complaints by entering customer details such as customer ID, name, email, phone number, address, complaint issue, and priority. Each complaint receives a unique complaint ID and submission date. The complaint can then be categorized into areas such as Billing, Technical Issue, Product Quality, Delivery, or Customer Service. Based on the category, the system assigns the relevant department and support staff.

The system stores complaint records in in-memory tables without using SQL or an external database. Users can search complaints using customer ID, update complaint status as Under Review, In Progress, Resolved, or Closed, and add remarks for each update. A notification is generated for the customer whenever the complaint status changes.

This project improves transparency, reduces manual work, ensures proper complaint tracking, and supports faster customer service.
